

For NPRE 297, your total grade will be earned through multiple computational exercises as well as contribution to the EINSTEIN project, focused on Accelerator Driven Subcritical System modeling and simulation. This work will include data collection, collaboration, and potential code contributions to tools in the Cyclus ecosystem. This independent study is intended to tie together ideas regarding data science, reproducible scientific computing, and numerical methods for nuclear engineering.

The primary work will be to support new work on developing models for Accelerator Driven Subcritical system targets and their transmutation under bombardment. This work will begin with research and data collection, with the possibility of developing user-friendly code contributions for use in Cyclus ecosystem modules. Software development can take place using personal or local workstations, or if needed, cluster computing capabilities. Data and software contributions resulting from this work will be contributed to the open source repositories at github.com/arfc.

The student will be expected to consistently engage with the lead graduate student in this work as well as Prof. Huff. The deliverables will include commits to online code repositories as well as a final report and presentation summarizing accomplishments by the end of the semester. The project will be assessed as independent research work, much like a journal article undergoes peer review. I will be looking for :

- Relevance
- Technical Detail
- Analytic Rigor
- Verifiability
- Clarity
- A Conclusion

This work will consist of four deliverables:

- a work plan,
- completion of the Software Carpentry Git and GitHub training,
- collaborative code development toward an ADS model in Cyclus,
- a brief summary report in the style of a conference or journal paper,
- and a 10 minute summary presentation.

1. (10 points) **Work Plan: Due 2025.09.05**

To help establish scope and milestones, the first step of the project will be a work plan. This plan, developed under supervision of an Advanced Reactors and Fuel Cycles Research Group Graduate Research Assistant, will be delivered in the form of multiple GitHub issues with descriptions and deadlines describing the work you intend to do in the ARFC group. Start with completing the ARFC new member checklist.

Please arrange at least one short meeting with Prof. Huff to discuss the project plan so that I can help you refine your schedule. I would be happy to provide feedback on a draft of your plan (once) before it is due.

2. (10 points) **Git and GitHub Self-Study: Due 2025.09.19** Conduct the full novice tutorial hosted at Software Carpentry.

3. (60 points) **Software Contributions: Due 2025.12.10** Complete the full suite of GitHub Issues agreed upon as a part of the Work Plan, within the due dates specified in each issue. All issues must be completed by 2025.12.10. This will require responsive completion of all necessary pull requests in collaboration with colleagues within the ARFC group.
4. (20 points) **Final Report and Presentation: Due 2025.12.10** The final report must be submitted to Prof. Huff and a summary presentation will be given to the ARFC group during a weekly group meeting late in the semester.
